イロト イロト イヨト イヨト

A classical result in coding theory:

Theorem (MacWilliams)

Let  $\mathscr{C} \leq \mathbb{F}_q^n$  be a code with the Hamming metric. Then for all  $0 \leq j \leq n$  we have

$$W^{\mathsf{H}}_{j}(\mathscr{C}^{\perp}) = \sum_{i=0}^{n} \sum_{\ell=0}^{j} (-1)^{\ell} (q-1)^{j-\ell} {i \choose \ell} {n-i \choose j-\ell} W^{\mathsf{H}}_{i}(\mathscr{C}).$$

These identities are invertible.

イロト イヨト イヨト - ヨトー

A classical result in coding theory:

Theorem (MacWilliams)

Let  $\mathscr{C} \leq \mathbb{F}_q^n$  be a code with the Hamming metric. Then for all  $0 \leq j \leq n$  we have

$$W^{\mathsf{H}}_{j}(\mathscr{C}^{\perp}) = \sum_{i=0}^{n} \sum_{\ell=0}^{j} (-1)^{\ell} (q-1)^{j-\ell} {i \choose \ell} {n-i \choose j-\ell} W^{\mathsf{H}}_{i}(\mathscr{C}).$$

These identities are invertible.

Generalizations of this result have been extensively studied in various contexts:

- association schemes
- finite abelian groups
- posets and lattices

<ロト < 回 ト < 回 ト < 回 ト - 三 三</p>

# **Group Characters**

#### Definition

Let (G, +) be a finite abelian group. The character group of G is

$$\widehat{G} = \{ ext{group homomorphisms } \chi : G o \mathbb{C}^* \}$$

endowed with point-wise multiplication:

 $\chi_1\cdot\chi_2\ (g)=\chi_1(g)\cdot\chi_2(g) \quad \text{for all } g\in G.$ 

# **Group Characters**

### Definition

Let (G, +) be a finite abelian group. The character group of G is

$$\widehat{G} = \{ \mathsf{group} \ \mathsf{homomorphisms} \ \chi : G \to \mathbb{C}^* \}$$

endowed with point-wise multiplication:

$$\chi_1\cdot\chi_2\ (g)=\chi_1(g)\cdot\chi_2(g) \quad ext{for all } g\in G.$$

We focus on a special situation:

- (G, +) = (V, +) is the additive group of a finite-dimensional linear space over  $\mathbb{F}_q$
- V is endowed with a given scalar product  $\langle \cdot \cdot 
  angle$

### Remark

 $(\widehat{V},\cdot)$  has a natural structure of  $\mathbb{F}_q$ -linear space via

$$a\chi(v) = \chi(av), \qquad a \in \mathbb{F}_q, \ v \in V.$$

Moreover,  $\dim(V) = \dim(\widehat{V})$ .

< ロ ト < 回 ト < 三 ト < 三 ト</p>

We focus on a special situation:

- (G,+) = (V,+) is the additive group of a finite-dimensional linear space over  $\mathbb{F}_q$
- V is endowed with a given scalar product  $\langle \cdot \cdot \rangle : V \times V \to \mathbb{F}_q$

#### Remark

 $\langle\cdot\,\cdot
angle$  can be used to identify the spaces (V,+) and ( $\widehat{V},\cdot$ ) as follows.

Fix a non-trivial character  $\xi:\mathbb{F}_q\to\mathbb{C}^*$  (it exists) and let

$$\psi_{\xi}:V o \widehat{V},\qquad \psi_{\xi}(v)(w)=\xi(\langle v,w
angle) ext{ for all }v,w\in V.$$

We focus on a special situation:

- (G,+) = (V,+) is the additive group of a finite-dimensional linear space over  $\mathbb{F}_q$
- V is endowed with a given scalar product  $\langle \cdot \cdot \rangle : V \times V \to \mathbb{F}_q$

#### Remark

 $\langle\cdot\,\cdot
angle$  can be used to identify the spaces (V,+) and ( $\widehat{V},\cdot$ ) as follows.

Fix a non-trivial character  $\xi: \mathbb{F}_q \to \mathbb{C}^*$  (it exists) and let

$$\psi_{\xi}:V o \widehat{V},\qquad \psi_{\xi}(v)(w)=\xi(\langle v,w
angle) ext{ for all }v,w\in V.$$

### Theorem (Folklore)

 $\psi_{\xi}$  is an  $\mathbb{F}_{q}$ -isomorphism of linear spaces whenever  $\xi$  is non-trivial.

Different choices of  $\xi$  give different identifications. However, all the objects we are interested in will not depend on the choice of  $\xi$ .

$$igtleacologo$$
 I am using  $\xi$  to define  $\widehat{\mathscr{P}}$ . However,

### Proposition

```
\widehat{\mathscr{P}} does not depend on \xi, if \mathscr{P} is invariant.
```

DQA

イロト イヨト イヨト - ヨトー

DATA:

- V an  $\mathbb{F}_q$ -space of finite dimension
- $\langle\cdot\cdot
  angle$  a scalar product on V
- $\mathscr{P} = \{P_i\}_{i \in I}$  an invariant partition of V

**CONSTRUCTION**: the dual partition  $\widehat{\mathscr{P}} = \{Q_j\}_{j \in J}$  of V (which is invariant as well)

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ ▲ □ ▶ ④ ヘ ⊙

### DATA:

- V an  $\mathbb{F}_q$ -space of finite dimension
- $\langle\cdot\cdot
  angle$  a scalar product on V
- $\mathscr{P} = \{P_i\}_{i \in I}$  an invariant partition of V

**CONSTRUCTION**: the dual partition  $\widehat{\mathscr{P}} = \{Q_i\}_{i \in J}$  of V (which is invariant as well)

#### Definition

A code is an  $\mathbb{F}_q$ -subspace of V. Its dual is

$$\mathscr{C}^{\perp} = \{ w \in V \mid \langle v, w \rangle = 0 ext{ for all } v \in \mathscr{C} \} \leq V.$$

Define:

- the  $\mathscr{P}$ -distribution of  $\mathscr{C}$ :  $\mathscr{P}(\mathscr{C},i) = |\mathscr{C} \cap P_i|, i \in I.$
- the  $\widehat{\mathscr{P}}$ -distribution of  $\mathscr{C}^{\perp}$ :  $\widehat{\mathscr{P}}(\mathscr{C}^{\perp}, j) = |\mathscr{C}^{\perp} \cap Q_j|, j \in J.$

Under certain conditions, MacWilliams-type identities hold for the  $\mathscr{P}$ - and  $\widehat{\mathscr{P}}$ -partition.

Sac

# MacWilliams-type Identities

We say that  $\mathscr{P}$  is Fourier-reflexive if  $|\mathscr{P}| = |\widehat{\mathscr{P}}|$  and self-dual if  $\widehat{\mathscr{P}} = \mathscr{P}$ . (self-dual  $\implies$  Fourier-reflexive)

590

・ロト ・ 四ト ・ ヨト ・ ヨト

## MacWilliams-type Identities

We say that  $\mathscr{P}$  is **Fourier-reflexive** if  $|\mathscr{P}| = |\widehat{\mathscr{P}}|$  and **self-dual** if  $\widehat{\mathscr{P}} = \mathscr{P}$ . (self-dual  $\Longrightarrow$  Fourier-reflexive)

Theorem (Generalized MacWilliams Identities)

Let  $\mathscr{P} = \{P_i\}_{i \in I}$  be invariant and Fourier-reflexive.

Let  $\widehat{\mathscr{P}} = \{Q_j\}_{j \in J}$ . Let  $\mathscr{C} \leq V$  be a code. We have

$$\widehat{\mathscr{P}}(\mathscr{C}^{\perp},j) = \frac{1}{|\mathscr{C}|} \sum_{i \in I} \mathcal{K}(\mathscr{P};i,j) \cdot \mathscr{P}(\mathscr{C},i),$$

where  $K(\mathscr{P}; i, j)$  are suitable numbers called **Krawtchouk coefficients**. Moreover, the matrix of the  $K(\mathscr{P}; i, j)$  is of size  $|I| \times |J| = |I| \times |I|$  and invertible.

SQR

## MacWilliams-type Identities

We say that  $\mathscr{P}$  is **Fourier-reflexive** if  $|\mathscr{P}| = |\widehat{\mathscr{P}}|$  and **self-dual** if  $\widehat{\mathscr{P}} = \mathscr{P}$ . (self-dual  $\Longrightarrow$  Fourier-reflexive)

Theorem (Generalized MacWilliams Identities)

Let  $\mathscr{P} = \{P_i\}_{i \in I}$  be invariant and Fourier-reflexive.

Let  $\widehat{\mathscr{P}} = \{Q_j\}_{j \in J}$ . Let  $\mathscr{C} \leq V$  be a code. We have

$$\widehat{\mathscr{P}}(\mathscr{C}^{\perp},j) = \frac{1}{|\mathscr{C}|} \sum_{i \in I} \mathcal{K}(\mathscr{P};i,j) \cdot \mathscr{P}(\mathscr{C},i),$$

where  $K(\mathscr{P}; i, j)$  are suitable numbers called **Krawtchouk coefficients**. Moreover, the matrix of the  $K(\mathscr{P}; i, j)$  is of size  $|I| \times |J| = |I| \times |I|$  and invertible.

#### Definition

$$\mathcal{K}(\mathscr{P}; i, j) = \sum_{w \in Q_j} \psi_{\xi}(w)(v), \text{ where } v \text{ is any vector in } P_i.$$

Again, this does not depend on  $\xi$  for invariant partitions.

### Problems

Given V with  $\langle \cdot \cdot \rangle$ ,

- Construct Fourier-reflexive partitions  ${\mathscr P}$
- Describe  $\widehat{\mathscr{P}}$  and decide if  $\widehat{\mathscr{P}} = \mathscr{P}$  (self-duality)
- Compute  $K(\mathcal{P}; i, j)$

<ロト <回ト < 回ト < 回ト -

### Problems

Given V with  $\langle \cdot \cdot \rangle$ ,

- Construct Fourier-reflexive partitions  ${\mathscr P}$
- Describe  $\widehat{\mathscr{P}}$  and decide if  $\widehat{\mathscr{P}} = \mathscr{P}$  (self-duality)
- Compute  $K(\mathcal{P}; i, j)$

### Theorem (essentially Delsarte)

The rank partition on  $\mathbb{F}_{a}^{n \times m}$  is self-dual of size m+1. Moreover,

$$\mathcal{K}(\mathscr{P}^{\mathsf{rk}};i,j) = \sum_{\ell=0}^{m} (-1)^{j-\ell} q^{n\ell+\binom{j-\ell}{2}} \begin{bmatrix} m-\ell \\ m-j \end{bmatrix}_{q} \begin{bmatrix} m-i \\ \ell \end{bmatrix}_{q}$$

We concentrate on the matrix space  $\mathbb{F}_{q}^{n \times m}$  with  $n \geq m$  endowed with the **trace product**:

$$\langle M, N \rangle = \operatorname{Tr}(MN^t).$$

# Other partitions

We study:

- the row-space partition  $\mathscr{P}^{\mathsf{rs}}$
- the pivot partition  $\mathscr{P}^{\mathsf{piv}}$

These are invariant partitions of  $\mathbb{F}_{q}^{n \times m}$ .

Results (Gluesing-Luerssen, R.):

- $\bullet \ \mathscr{P}^{\rm rs} \ {\rm is \ self-dual}$
- explicit formula for the Krawtchouk coefficients of  $\mathscr{P}^{\mathrm{rs}}$
- the pivot partition  $\mathscr{P}^{\mathsf{piv}}$  is Fourier-reflexive (not self-dual)
- $\bullet$  connection between the Krawtchouk coefficients of  $\mathscr{P}^{\mathsf{piv}}$  and rook theory
- $\bullet$  notions of extremality from  $\mathscr{P}^{\mathsf{rs}}$  and  $\mathscr{P}^{\mathsf{piv}},$  and properties of extremal codes
- MacWilliams extension theorem fails for these partitions

・ コ ト ・ 雪 ト ・ 目 ト

 $\mathscr{P}^{\mathsf{rs}}$  partitions the elements of  $\mathbb{F}_q^{n \times m}$  according to their row-spaces. We have:

$$|\mathscr{P}^{\mathsf{rs}}| = \sum_{i=0}^{m} \begin{bmatrix} m \\ i \end{bmatrix}_{q}$$
 (recall:  $m \le n$ )

2 Feb. 2019 9/19

996

< ロ > < 四 > < 三 > < 三 > 、

 $\mathscr{P}^{rs}$  partitions the elements of  $\mathbb{F}_{a}^{n \times m}$  according to their row-spaces. We have:

$$|\mathscr{P}^{\mathsf{rs}}| = \sum_{i=0}^{m} \begin{bmatrix} m \\ i \end{bmatrix}_{q}$$
 (recall:  $m \le n$ )

Theorem (Gluesing-Luerssen, R.)

 $\mathscr{P}^{rs}$  is self-dual, i.e.,  $\widehat{\mathscr{P}^{rs}} = \mathscr{P}^{rs}$ .

Tool in the proof: group actions.

$$\rho: \mathsf{GL}_n(\mathbb{F}_q) \times \mathbb{F}_q^{n \times m} \to \mathbb{F}_q^{n \times m}, \qquad (G, M) \mapsto GM$$

Then the blocks of  $\mathscr{P}^{rs}$  are the orbits of  $\rho$ , from which Fourier-reflexivity follows easily.

590

イロト イヨト イヨト イヨト 二日

 $\mathscr{P}^{rs}$  partitions the elements of  $\mathbb{F}_{a}^{n \times m}$  according to their row-spaces. We have:

$$|\mathscr{P}^{\mathsf{rs}}| = \sum_{i=0}^{m} \begin{bmatrix} m \\ i \end{bmatrix}_{q}$$
 (recall:  $m \le n$ )

Theorem (Gluesing-Luerssen, R.)

 $\mathscr{P}^{rs}$  is self-dual, i.e.,  $\widehat{\mathscr{P}^{rs}} = \mathscr{P}^{rs}$ .

Tool in the proof: group actions.

$$\rho: \mathsf{GL}_n(\mathbb{F}_q) \times \mathbb{F}_q^{n \times m} \to \mathbb{F}_q^{n \times m}, \qquad (G, M) \mapsto GM$$

Then the blocks of  $\mathscr{P}^{rs}$  are the orbits of  $\rho$ , from which Fourier-reflexivity follows easily.

This argument does not give a formula for the Krawtchouk coefficients.

イロト イヨト イヨト イヨト 二日

Recall:  $\mathscr{P} = (P_i)_{i \in I}, \quad \widehat{\mathscr{P}} = (Q_j)_{j \in J}$  invariant partitions. Then  $\mathcal{K}(\mathscr{P}; i, j) := \sum_{w \in Q_j} \psi_{\xi}(w)(v), \quad \text{where } v \text{ is any vector in } P_i$ 

(independent of  $\xi$ ).

Recall:  $\mathscr{P} = (P_i)_{i \in I}, \quad \widehat{\mathscr{P}} = (Q_j)_{j \in J}$  invariant partitions. Then  $\mathcal{K}(\mathscr{P}; i, j) := \sum_{w \in Q_j} \psi_{\xi}(w)(v), \quad \text{where } v \text{ is any vector in } P_i$ 

(independent of  $\xi$ ).

Theorem (Gluesing-Luerssen, R.)

For  $U, V \leq \mathbb{F}_q^m$  we have

$$\mathcal{K}(\mathscr{P}^{\mathsf{rs}}; U, V) = \sum_{t=0}^{m} (-1)^{\dim(U)-t} q^{nt+\binom{\dim(U)-t}{2}} \begin{bmatrix} \dim(U \cap V^{\perp}) \\ t \end{bmatrix}_{q}$$

Recall:  $\mathscr{P} = (P_i)_{i \in I}, \quad \widehat{\mathscr{P}} = (Q_j)_{j \in J}$  invariant partitions. Then  $\mathcal{K}(\mathscr{P}; i, j) := \sum_{w \in Q_j} \psi_{\xi}(w)(v), \quad \text{where } v \text{ is any vector in } P_i$ 

(independent of  $\xi$ ).

Theorem (Gluesing-Luerssen, R.)

For  $U, V \leq \mathbb{F}_q^m$  we have

$$\mathcal{K}(\mathscr{P}^{\mathsf{rs}}; U, V) = \sum_{t=0}^{m} (-1)^{\dim(U)-t} q^{nt + \binom{\dim(U)-t}{2}} \binom{\dim(U \cap V^{\perp})}{t}_{q}$$

Ingredients of the proof: some combinatorics and character theory.

Let  $\mathscr{L}$  be the lattice of subspaces of  $\mathbb{F}_q^m$ . Consider the map

$$\sigma: \mathbb{F}_q^{n \times m} \to \mathscr{L}, \qquad \sigma(M) := \mathrm{rs}(M).$$

This map is a **regular support** in the sense of *Duality of codes supported*... (R.'17). This connection allows one to evaluate character sums using Mœbius inversion.

- if  $(i,j) \in \mathscr{F}$  and j < m, then  $(i,j+1) \in \mathscr{F}$  (right aligned),
- 2 if  $(i,j) \in \mathscr{F}$  and i > 1, then  $(i-1,j) \in \mathscr{F}$  (top aligned).

We represent a Ferrers diagram by its column lengths,  $\mathscr{F} = [c_1, \ldots, c_m]$ . E.g.

$$\mathscr{F} = \qquad \begin{array}{c} \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \end{array} = [1,3,3,4]$$

We denote by  $\mathbb{F}_q[\mathscr{F}]$  the space of matrices supported on  $\mathscr{F}$ , and let

$$P_r(\mathscr{F}) := \{ M \in \mathbb{F}_q[\mathscr{F}] \mid \mathsf{rk}(M) = r \}.$$

We can express the Krawtchouk coefficients of  $\mathscr{P}^{\text{piv}}$  in terms of  $P_r(\mathscr{F})$ , for certain r and for a suitable diagram  $\mathscr{F}$ .

Theorem (Gluesing-Luerssen, R.)

Let  $\lambda, \mu \in \Pi$ . Set

$$\sigma = [m] \setminus \mu, \qquad \lambda \cap \sigma = (\lambda_{\alpha_1}, \dots, \lambda_{\alpha_x}), \qquad \mu \setminus \lambda = (\mu_{\beta_1}, \dots, \mu_{\beta_y}).$$

Furthermore, set

$$z_j = |\{i \in [x] \mid \lambda_{lpha_i} < \mu_{eta_j}\}| \quad \text{for } j \in [y], \qquad \mathscr{F} = [z_1, \dots, z_y].$$

DQC

イロト イロト イヨト イヨト

Theorem (Gluesing-Luerssen, R.)

Let  $\lambda, \mu \in \Pi$ . Set

$$\sigma = [m] \setminus \mu, \qquad \lambda \cap \sigma = (\lambda_{\alpha_1}, \dots, \lambda_{\alpha_x}), \qquad \mu \setminus \lambda = (\mu_{\beta_1}, \dots, \mu_{\beta_y})$$

Furthermore, set

$$z_j = |\{i \in [x] \mid \lambda_{\alpha_i} < \mu_{\beta_j}\}|$$
 for  $j \in [y]$ ,  $\mathscr{F} = [z_1, \dots, z_y]$ .

Then

$$\mathcal{K}(\mathscr{P}^{\mathsf{piv}};\lambda,\mu) = \sum_{t=0}^{m} (-1)^{|\lambda|-t} q^{nt + \binom{|\lambda|-t}{2}} \sum_{r=0}^{|\lambda \cap \sigma|} P_r(\mathscr{F}) \begin{bmatrix} |\lambda \cap \sigma| - r \\ t \end{bmatrix}_{q}$$

DQC

< ロ ト < 回 ト < 三 ト < 三 ト</p>

Theorem (Gluesing-Luerssen, R.)

Let  $\lambda, \mu \in \Pi$ . Set

$$\sigma = [m] \setminus \mu, \qquad \lambda \cap \sigma = (\lambda_{\alpha_1}, \ldots, \lambda_{\alpha_x}), \qquad \mu \setminus \lambda = (\mu_{\beta_1}, \ldots, \mu_{\beta_y}).$$

Furthermore, set

$$z_j = |\{i \in [x] \mid \lambda_{\alpha_i} < \mu_{\beta_j}\}|$$
 for  $j \in [y]$ ,  $\mathscr{F} = [z_1, \dots, z_y]$ .

Then

$$\mathcal{K}(\mathscr{P}^{\mathsf{piv}};\lambda,\mu) = \sum_{t=0}^{m} (-1)^{|\lambda|-t} q^{nt + \binom{|\lambda|-t}{2}} \sum_{r=0}^{|\lambda \cap \sigma|} P_r(\mathscr{F}) \begin{bmatrix} |\lambda \cap \sigma| - r \\ t \end{bmatrix}_{\mathcal{A}}$$

Therefore,  $\mathcal{K}(\mathscr{P}^{\mathsf{piv}}; \lambda, \mu)$  can be expressed in terms of the rank-distribution of  $\mathbb{F}_q(\mathscr{F})$  for a suitable  $\mathscr{F} \to \mathsf{rook}$  theory

Feb. 2019 15 / 19

#### Definition

The *q*-rook polynomial associated with  $\mathscr{F}$  and  $r \ge 0$  is

$$R_r(\mathscr{F}) = \sum_{C \in \mathsf{NAR}_r(\mathscr{F})} q^{\mathsf{inv}(C,\mathscr{F})} \in \mathbb{Z}[q],$$

where:

- NAR<sub>r</sub>(𝔅) is the set of all placements of r non-attacking rooks on 𝔅 (non-attacking means that no two rooks are in the same column, and no two are in the same row)
- $inv(C, \mathscr{F}) \in \mathbb{N}$  is computed as shown on the blackboard

#### Theorem (Haglund)

For any Ferrers diagram  $\mathscr{F}$  and any  $r \ge 0$  we have

$$P_r(\mathscr{F}) = (q-1)^r q^{|\mathscr{F}|-r} R_r(\mathscr{F})_{|q^{-1}}$$

in the ring  $\mathbb{Z}[q,q^{-1}]$ .

**Natural task**: find an explicit expression for  $R_r(\mathscr{F})$ .

nan

イロト イヨト イヨト イヨト 三日

An explicit formula for  $R_r(\mathscr{F})$ :

#### Theorem (Gluesing-Luerssen, R.)

Let  $\mathscr{F} = [c_1, \ldots, c_m]$  be an  $n \times m$ -Ferrers diagram. For  $k \in [m]$  define  $a_k = c_k - k + 1$ .

For  $j \in [m]$  let  $\sigma_j \in \mathbb{Q}[x_1, \dots, x_m]$  be the  $j^{\text{th}}$  elementary symmetric polynomial in m indeterminates ( $\sigma_0 = 1, \dots, \sigma_m = x_1 \cdots x_m$ ).

Then

$$R_r(q) = \frac{q^{\binom{r+1}{2}-rm+\operatorname{area}(\mathscr{F})}(-1)^{m-r}}{(1-q)^r \prod_{k=1}^{m-r}(1-q^k)} \sum_{t=m-r}^m (-1)^t \sigma_{m-t}(q^{-a_1},\ldots,q^{-a_m}) \prod_{j=0}^{m-r-1} (1-q^{t-j}).$$

An explicit formula for  $R_r(\mathscr{F})$ :

#### Theorem (Gluesing-Luerssen, R.)

Let  $\mathscr{F} = [c_1, \dots, c_m]$  be an  $n \times m$ -Ferrers diagram. For  $k \in [m]$  define  $a_k = c_k - k + 1$ .

For  $j \in [m]$  let  $\sigma_j \in \mathbb{Q}[x_1, \dots, x_m]$  be the  $j^{\text{th}}$  elementary symmetric polynomial in m indeterminates ( $\sigma_0 = 1, \dots, \sigma_m = x_1 \cdots x_m$ ).

Then

$$R_r(q) = \frac{q^{\binom{r+1}{2}-rm+\operatorname{area}(\mathscr{F})}(-1)^{m-r}}{(1-q)^r \prod_{k=1}^{m-r}(1-q^k)} \sum_{t=m-r}^m (-1)^t \sigma_{m-t}(q^{-a_1},\ldots,q^{-a_m}) \prod_{j=0}^{m-r-1} (1-q^{t-j}).$$

Combining this with Haglund's theorem we find an explicit expression for  $P_r(\mathscr{F})$ .

Proof is long and technical.

< □ > < □ > < 三 > < 三 > < 三 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

A different approach: compute  $P_r(\mathscr{F})$  directly. Notation:  $\mathscr{F} = [c_1, ..., c_m]$ .

Theorem (Gluesing-Luerssen, R.)

$$P_r(\mathscr{F}) = \sum_{1 \le i_1 < \cdots < i_r \le m} q^{rm - \sum_{j=1}^r i_j} \prod_{j=1}^r (q^{c_{i_j} - j + 1} - 1).$$

Proof is short.

A different approach: compute  $P_r(\mathscr{F})$  directly. Notation:  $\mathscr{F} = [c_1, ..., c_m]$ .

Theorem (Gluesing-Luerssen, R.)

$$P_r(\mathscr{F}) = \sum_{1 \leq i_1 < \cdots < i_r \leq m} q^{rm - \sum_{j=1}^r i_j} \prod_{j=1}^r (q^{c_{i_j} - j + 1} - 1).$$

Proof is short.

But inverting Haglund's theorem we also find a simple explicit formula for  $R_r(\mathscr{F})!$ 

Corollary (Gluesing-Luerssen, R.)

$$R_{r}(\mathscr{F}) = \frac{q^{\sum_{j=1}^{m} c_{j} - rm} \sum_{1 \le i_{1} < \dots < i_{r} \le m} \prod_{j=1}^{r} (q^{i_{j} + j - c_{i_{j}} - 1} - q^{i_{j}})}{(1 - q)^{r}}$$
